# CODE SECURITY ASSESSMENT

B O N S A I   S T R I K E

# Overview

## Project Summary

- Name: Bonsai Strike
- Version: 3.0
- Platform: BSC
- Language: Solidity
- Repository:
  - <https://github.com/pengpeng/bonsai/commits/54a99607db7aad4e62bc9350d4ef6e529852157b>
- Audit Scope: See [Appendix A](#)

## Project Dashboard

### Application Summary

Name	Bonsai Strike
Version	v3.0
Type	Solidity
Dates	Jan 11 2023
Logs	Dec 12 2022; Dec 20 2022; Jan 11 2023

### Vulnerability Summary

Total High-Severity issues	0
Total Medium-Severity issues	1
Total Low-Severity issues	1
Total informational issues	6
<b>TOTAL</b>	8

# Contact

E-mail: [support@salusec.io](mailto:support@salusec.io)

## Risk Level Description

<b>High Risk</b>	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for clients' reputation or serious financial implications for client and users.
<b>Medium Risk</b>	The issue puts a subset of users' sensitive information at risk, would be detrimental for the client's reputation if exploited, or is reasonably likely to lead to moderate financial impact.
<b>Low Risk</b>	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low impact in view of the client's business circumstances.
<b>Informational</b>	The issue does not post an immediate risk, but is relevant to security best practices or Defence in Depth.

# Introduction

## 1.1 About SALUS

At Salus Security, we are in the business of trust.

We are dedicated to tackling the toughest security challenges facing the industry today. By building foundational trust into technology and infrastructure through security, we help clients to lead their respective industries and unlock their full Web3 potential.

Our team of security experts employ industry-leading proof-of-concept (PoC) methodology for demonstrating smart contract vulnerabilities, coupled with advanced red teaming capabilities and a stereoscopic vulnerability detection system, to deliver comprehensive security assessments that allow clients to stay ahead of the curve.

In addition to smart contract audits and red teaming, our Rapid Detection Service for smart contracts aims to make security accessible to all. This high calibre, yet cost-efficient, security tool has been designed to support a wide range of business needs including investment due diligence, security and code quality assessments, and code optimisation.

We are Salus Security – the ultimate security solution for Web3.

## 1.2 Audit Breakdown

The objective was to evaluate the repository for security-related issues, code quality, and adherence to specifications and best practices. Possible issues we looked for included (but are not limited to):

- Risky external calls
- Integer overflow/underflow
- Transaction-ordering dependence
- Timestamp dependence
- Access control
- Call stack limits and mishandled exceptions
- Number rounding errors
- Centralization of power
- Logical oversights and denial of service
- Business logic specification
- Code clones, functionality duplication

## 1.3 Disclaimer

Note that this security audit is not designed to replace functional tests required before any software release and does not give any warranties on finding all possible security issues with the given smart contract(s) or blockchain software, i.e. The evaluation result does not guarantee the nonexistence of any further findings of security issues.

# Findings

## 2.1 Summary of Findings

ID	Title	Severity	Category	Status
1	Incorrect handling of premium decimal	Medium	Business Logic	Resolved
2	Inconsistent Solidity versions	Low	Configuration	Acknowledged
3	Redundant code	Informational	Redundancy	Acknowledged
4	Custom error could be used	Informational	Auditing and Logging	Acknowledged
5	Incorrect comment	Informational	Documentation	Resolved
6	Magic numbers are used	Informational	Code Quality	Acknowledged
7	External call to an out of scope address	Informational	Undefined Behavior	Acknowledged
8	Centralization risk	Informational	Centralization	Acknowledged

## 2.2 Notable Findings

Significant flaws that impact system confidentiality, integrity, or availability are listed below.

### 1. Incorrect handling of premium decimal

Severity: Medium

Category: Business Logic

Target:

- cvol/contracts/core/OptionsPremiumPricerInStables.sol
- core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol

#### Description

**cvol/contracts/core/OptionsPremiumPricerInStables.sol:L122-152**

```
function _getPremium(
    uint256 st,
    uint256 sp,
    uint256 expiryTimestamp,
    uint256 assetPrice,
    uint256 assetDecimals,
    bool isPut
) internal view returns (uint256 premium) {
    require(
        expiryTimestamp > block.timestamp,
        "Expiry must be in the future!"
    );

    uint256 v;
    uint256 t;
    (sp, v, t) = blackScholesParams(sp, expiryTimestamp);

    (uint256 call, uint256 put) = quoteAll(t, v, sp, st);

    // Multiplier to convert oracle LatestAnswer to 18 decimals
    uint256 assetOracleMultiplier = 10**uint256(18).sub(assetDecimals);

    // Make option premium denominated in the underlying
    // asset for call vaults and USDC for put vaults
    premium = isPut
        ? wdiv(put, assetPrice.mul(assetOracleMultiplier))
        : wdiv(call, assetPrice.mul(assetOracleMultiplier));

    // Convert to 18 decim als
    premium = premium.mul(assetOracleMultiplier);
}
```

core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol: L337-374

```
function commitAndClose() external nonReentrant {
    address oldOption = optionState.currentOption;

    VaultLifecycle.CloseParams memory closeParams =
    VaultLifecycle.CloseParams({
        OTOKEN_FACTORY: OTOKEN_FACTORY,
        USDC: USDC,
        currentOption: oldOption,
        delay: DELAY,
        lastStrikeOverrideRound: lastStrikeOverrideRound,
        overriddenStrikePrice: overriddenStrikePrice,
        strikeSelection: strikeSelection,
        optionsPremiumPricer: optionsPremiumPricer,
        premiumDiscount: premiumDiscount
    });

    (address otokenAddress, uint256 premium, uint256 strikePrice,
    uint256 delta) =
        VaultLifecycle.commitAndClose(closeParams, vaultParams,
    vaultState);

    emit NewOptionStrikeSelected(strikePrice, delta);

    ShareMath.assertUint104(premium);
    currentOtkenPremium = uint104(premium);
    optionState.nextOption = otkenAddress;

    uint256 nextOptionReady = block.timestamp.add(DELAY);
    require(nextOptionReady <= type(uint32).max, "Overflow
nextOptionReady");
    optionState.nextOptionReadyAt = uint32(nextOptionReady);

    _closeShort(oldOption);
}
```

The **premium** returned from `_getPremium()` is converted to 18 decimal points. However, the premium has not been scaled to the asset's decimal in `commitAndClose()`. As a result, when the asset does not have 18 decimal points, the **currentOtkenPremium** would be miscalculated.

## Recommendation

Consider converting the premium to the asset's decimal in `_getPremium()`.

## Status

This issue has been resolved by the team in commit [d151b4d](#). The premium is scaled to the asset's decimal in `commitAndClose()`.

core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol: L337-381

```
function commitAndClose() external nonReentrant {
    address oldOption = optionState.currentOption;

    VaultLifecycle.CloseParams memory closeParams =
        VaultLifecycle.CloseParams({
            OTOKEN_FACTORY: OTOKEN_FACTORY,
            USDC: USDC,
            currentOption: oldOption,
            delay: DELAY,
            lastStrikeOverrideRound: lastStrikeOverrideRound,
            overriddenStrikePrice: overriddenStrikePrice,
            strikeSelection: strikeSelection,
            optionsPremiumPricer: optionsPremiumPricer,
            premiumDiscount: premiumDiscount
        });

    (
        address otokenAddress,
        uint256 premium,
        uint256 strikePrice,
        uint256 delta
    ) = VaultLifecycle.commitAndClose(closeParams, vaultParams,
    vaultState);

    emit NewOptionStrikeSelected(strikePrice, delta);

    ShareMath.assertUint104(premium);

    // scaling premium to follow asset decimals
    uint256 decimals = vaultParams.decimals;
    premium = decimals > 18
        ? premium.mul(10***(decimals.sub(18)))
        : premium.div(10***(uint256(18).sub(decimals)));

    currentOtkenPremium = uint104(premium);
    optionState.nextOption = otkenAddress;

    uint256 nextOptionReady = block.timestamp.add(DELAY);
    require(
        nextOptionReady <= type(uint32).max,
        "Overflow nextOptionReady"
    );
    optionState.nextOptionReadyAt = uint32(nextOptionReady);

    _closeShort(oldOption);
}
```

## 2. Inconsistent Solidity versions

Severity: Low

Category: Configuration

Target: All files

### Description

Different Solidity versions are used throughout the project. For example: **core** uses 0.8.4, **cvol** uses 0.7.3, and **opyn** uses 0.6.10

Using different Solidity versions in one project makes it hard to build and test the project. Moreover, using outdated versions of Solidity prevents you from benefiting from bug fixes and newer security checks in the newer version.

### Recommendation

It is recommended to use consistent Solidity versions throughout the project. It is also recommended to use the most stable and up-to-date version.

### Status

This issue has been acknowledged by the team.

## 2.3 Informational Findings

### 3. Redundant code

Severity: Informational

Category: Redundancy

Target:

- core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol
- core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol
- core/contracts/libraries/VaultLifecycle.sol
- cvol/contracts/core/ManualVolOracle.sol
- opyn/contracts/pricers/CompoundPricer.sol
- opyn/contracts/pricers/WstethPricer.sol
- opyn/contracts/pricers/YearnPricer.sol

### Description

1. The following comments and codes about WETH in RibbonThetaVaultWithSwap and RibbonVault are not used.

**core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol: L22**

```
//import {IWETH} from "../../../../../interfaces/IWETH.sol";
```

**core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol: L82-83**

```
/// @notice WETH9 0xC02aaA39b223FE8D0A0e5C4F27eAD9083C756Cc2
//address public immutable WETH;
```

**core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol: L129-140**

```
constructor(
    // address _weth,
    address _usdc,
    address _oTokenFactory,
    address _gammaController,
    address _marginPool,
    address _swapContract
        //) RibbonVault(_weth, _usdc, _gammaController, _marginPool,
    _swapContract) {
) RibbonVault(_usdc, _gammaController, _marginPool, _swapContract) {
    require(_oTokenFactory != address(0), " !_oTokenFactory");
    OTOKEN_FACTORY = _oTokenFactory;
}
```

**core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol: L152-170**

```
constructor(
    // address _weth,
    address _usdc,
    address _gammaController,
    address _marginPool,
```

```

        address _swapContract
    ) {
        //require(_weth != address(0), " !_weth");
        require(_usdc != address(0), " !_usdc");
        require(_swapContract != address(0), " !_swapContract");
        require(_gammaController != address(0), " !_gammaController");
        require(_marginPool != address(0), " !_marginPool");

        // WETH = _weth;
        USDC = _usdc;
        GAMMA_CONTROLLER = _gammaController;
        MARGIN_POOL = _marginPool;
        SWAP_CONTRACT = _swapContract;
    }

```

**core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol: L298-308**

```

// /**
//  * @notice Deposits ETH into the contract and mint vault shares.
// Reverts if the asset is not WETH.
// */
// function depositETH() external payable nonReentrant {
//     require(vaultParams.asset == WETH, " !WETH");
//     require(msg.value > 0, " !value");

//     _depositFor(msg.value, msg.sender);

//     IWETH(WETH).deposit{value: msg.value}();
// }

```

**core/contracts/vaults/BaseVaultWithSwap/base/RibbonVault.sol: L643-648**

```

// if (asset == WETH) {
//     IWETH(WETH).withdraw(amount);
//     (bool success, ) = recipient.call{value: amount}("");
//     require(success, "Transfer failed");
//     return;
// }

```

2. The following codes related to naked are not used.

**opyn/contracts/core/Controller.sol: L111-115**

```

/// @dev mapping to store cap amount for naked margin vault per options
collateral asset (scaled by collateral asset decimals)
mapping(address => uint256) internal nakedCap;

/// @dev mapping to store amount of naked margin vaults in pool
mapping(address => uint256) internal nakedPoolBalance;

```

**opyn/contracts/core/Controller.sol: L212-213**

```

/// @notice emits an event when naked cap is updated
event NakedCapUpdated(address indexed collateral, uint256 cap);

```

**opyn/contracts/core/Controller.sol: L412-424**

```

/**

```

```

* @notice set cap amount for collateral asset used in naked margin
* @dev can only be called by owner
* @param _collateral collateral asset address
* @param _cap cap amount, should be scaled by collateral asset decimals
*/
function setNakedCap(address _collateral, uint256 _cap) external
onlyOwner {
    require(_cap > 0, "C36");

    nakedCap[_collateral] = _cap;

    emit NakedCapUpdated(_collateral, _cap);
}

```

#### opyn/contracts/core/Controller.sol: L620-604

```

/**
 * @notice get cap amount for collateral asset
* @param _asset collateral asset address
* @return cap amount
*/
function getNakedCap(address _asset) external view returns (uint256) {
    return nakedCap[_asset];
}

/**
 * @notice get amount of collateral deposited in all naked margin vaults
* @param _asset collateral asset address
* @return naked pool balance
*/
function getNakedPoolBalance(address _asset) external view returns
(uint256) {
    return nakedPoolBalance[_asset];
}

```

#### opyn/contracts/core/MarginCalculator.sol: L308-356

```

/**
 * @notice return the collateral required for naked margin vault, in
collateral asset decimals
 * @dev _shortAmount, _strikePrice and _underlyingPrice should be scaled
by 1e8
 * @param _underlying underlying asset address
 * @param _strike strike asset address
 * @param _collateral collateral asset address
 * @param _shortAmount amount of short otoken
 * @param _strikePrice otoken strike price
 * @param _underlyingPrice otoken underlying price
 * @param _shortExpiryTimestamp otoken expiry timestamp
 * @param _collateralDecimals otoken collateral asset decimals
 * @param _isPut otoken type
 * @return collateral required for a naked margin vault, in collateral
asset decimals
*/

```

```

function getNakedMarginRequired(
    address _underlying,
    address _strike,
    address _collateral,
    uint256 _shortAmount,
    uint256 _strikePrice,
    uint256 _underlyingPrice,
    uint256 _shortExpiryTimestamp,
    uint256 _collateralDecimals,
    bool _isPut
) external view returns (uint256) {
    bytes32 productHash = _getProductHash(_underlying, _strike,
    _collateral, _isPut);

    // scale short amount from 1e8 to 1e27 (oToken is always in 1e8)
    FPI.FixedPointInt memory shortAmount =
FPI.fromScaledUint(_shortAmount, BASE);
    // scale short strike from 1e8 to 1e27
    FPI.FixedPointInt memory shortStrike =
FPI.fromScaledUint(_strikePrice, BASE);
    // scale short underlying price from 1e8 to 1e27
    FPI.FixedPointInt memory shortUnderlyingPrice =
FPI.fromScaledUint(_underlyingPrice, BASE);

    // return required margin, scaled by collateral asset decimals,
    explicitly rounded up
    return
        FPI.toScaledUint(
            _getNakedMarginRequired(
                productHash,
                shortAmount,
                shortUnderlyingPrice,
                shortStrike,
                _shortExpiryTimestamp,
                _isPut
            ),
            _collateralDecimals,
            false
        );
}

```

### opyn/contracts/core/MarginCalculator.sol: L762-809

```

/**
 * @notice get required collateral for naked margin position
 * if put:
 * a = min(strike price, spot shock * underlying price)
 * b = max(strike price - spot shock * underlying price, 0)
 * marginRequired = (option upper bound value * a + b) * short amount
 * if call:
 * a = min(1, strike price / (underlying price / spot shock value))
 * b = max(1 - (strike price / (underlying price / spot shock value)), 0)
 * marginRequired = (option upper bound value * a + b) * short amount
 * @param _productHash product hash

```

```

* @param _shortAmount short amount in vault, in FixedPointInt type
* @param _strikePrice strike price of short otoken, in FixedPointInt
type
* @param _underlyingPrice underlying price of short otoken underlying
asset, in FixedPointInt type
* @param _shortExpiryTimestamp short otoken expiry timestamp
* @param _isPut otoken type, true if put option, false for call option
* @return required margin for this naked vault, in FixedPointInt type
(scaled by 1e27)
*/
function _getNakedMarginRequired(
    bytes32 _productHash,
    FPI.FixedPointInt memory _shortAmount,
    FPI.FixedPointInt memory _underlyingPrice,
    FPI.FixedPointInt memory _strikePrice,
    uint256 _shortExpiryTimestamp,
    bool _isPut
) internal view returns (FPI.FixedPointInt memory) {
    // find option upper bound value
    FPI.FixedPointInt memory optionUpperBoundValue =
    _findUpperBoundValue(_productHash, _shortExpiryTimestamp);
    // convert spot shock value of this product to FixedPointInt
    // (already scaled by 1e27)
    FPI.FixedPointInt memory spotShockValue =
    FPI.FixedPointInt(int256(spotShock[_productHash]));

    FPI.FixedPointInt memory a;
    FPI.FixedPointInt memory b;
    FPI.FixedPointInt memory marginRequired;

    if (_isPut) {
        a = FPI.min(_strikePrice, spotShockValue.mul(_underlyingPrice));
        b =
        FPI.max(_strikePrice.sub(spotShockValue.mul(_underlyingPrice)), ZERO);
        marginRequired =
        optionUpperBoundValue.mul(a).add(b).mul(_shortAmount);
    } else {
        FPI.FixedPointInt memory one = FPI.fromScaledUint(1e27,
SCALING_FACTOR);
        a =
        FPI.min(one,
        _strikePrice.mul(spotShockValue).div(_underlyingPrice));
        b =
        FPI.max(one.sub(_strikePrice.mul(spotShockValue).div(_underlyingPrice)),
ZERO);
        marginRequired =
        optionUpperBoundValue.mul(a).add(b).mul(_shortAmount);
    }

    return marginRequired;
}

```

3. The **vol()** function in the **ManualVolOracle.sol** file is not used.

**cvol/contracts/core/ManualVolOracle.sol: L50-52**

```

/**
 * @notice Returns the standard deviation of the base currency in 10**8
 * i.e. 1*10**8 = 100%
 * @return standardDeviation is the standard deviation of the asset
 */
function vol(bytes32) public pure returns (uint256 standardDeviation) {
    return 0;
}

```

4. **CompoundPricer.sol**, **WstethPricer.sol**, and **YearnPricer.sol** are not used.

5. The actionTypes of **DepositLongOption**, **WithdrawLongOption**, **Liquidate**, and **Call** are not used. Therefore, the lines of `_depositLong()`, `_withdrawLong()`, `_liquidate()`, `_call()` are not used.

**opyn/contracts/core/Controller.sol: L667-685**

```

if (actionType == Actions.ActionType.DepositLongOption) {
    _depositLong(Actions._parseDepositArgs(action));
}

if (actionType == Actions.ActionType.WithdrawLongOption) {
    _withdrawLong(Actions._parseWithdrawArgs(action));
}

if (actionType == Actions.ActionType.Liquidate) {
    _liquidate(Actions._parseLiquidateArgs(action));
}

if (actionType == Actions.ActionType.Call) {
    _call(Actions._parseCallArgs(action));
}

```

## Recommendation

Consider removing all redundant codes. Any unused imports, inherited contracts, functions, parameters, variables, modifiers, events, or return values should be removed (or used appropriately) before mainnet deployment. This will not only reduce gas costs but also improve the readability and maintainability of the code.

## Status

This issue has been acknowledged by the team.

## 4. Custom error could be used

Severity: Informational

Category: Auditing and Logging

Target:

- core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol

### Description

core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol: L138

```
require(_oTokenFactory != address(0), " !_oTokenFactory");
```

Starting from Solidity v0.8.4, there is a convenient and gas-efficient way to explain to users why an operation failed through the use of custom errors. It can reduce both gas usage and bytecode size.

### Recommendation

Consider using a custom error to replace the revert message.

```
error NotOTokenFactory();

if (_oTokenFactory == address(0)) {
    revert NotOTokenFactory();
}
```

### Status

This issue has been acknowledged by the team.

## 5. Incorrect comment

Severity: Informational

Category: Documentation

Target:

- core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol
- opyn/contracts/core/Controller.sol
- core/contracts/libraries/VaultLifecycle.sol

### Description

1. core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol: L101

```
/**
 * @notice Initialization parameters for the vault.
```

```

* @param _owner is the owner of the vault with critical permissions
* @param _feeRecipient is the address to receive vault performance and
management fees
* @param _managementFee is the management fee pct.
* @param _performanceFee is the performance fee pct.
* @param _tokenName is the name of the token
* @param _tokenSymbol is the symbol of the token
* @param _optionsPremiumPricer is the address of the contract with the
black-scholes premium calculation logic
* @param _strikeSelection is the address of the contract with strike
selection logic
* @param _premiumDiscount is the vault's discount applied to the
premium
* @param _auctionDuration is the duration of the gnosis auction
*/
struct InitParams {...}

```

The comment for **\_auctionDuration** says it is the duration of the **gnosis** auction, but it should be the duration of the **airswap** auction.

## 2. opyn/contracts/core/Controller.sol: L647

```
actions except Settle, Redeem, Liquidate and Call are Vault-updating
actinos
```

The word “**actinos**” is misspelled, and should be “**actions**” instead.

## 3. core/contracts/libraries/VaultLifecycle.sol: L541

```
// At the first round, currentBalance=0, pendingAmount>0
```

But the implementation is **currentBalance == pendingAmount** at the first round.

## Recommendation

Ensure that the code is well commented, both with NatSpec and inline comments, for better readability and maintainability. The comments should accurately reflect what the corresponding code does. Stale comments should be removed. Discrepancies between code and comments should be addressed.

## Status

The **\_auctionDuration** comment issue is resolved since the team has clarified that airswap is not related to **\_auctionDuration**. The comment issues in Controller and VaultLifecycle have been fixed in the commit: [75cd7ed](#).

## 6. Magic numbers are used

Severity: Informational

Category: Code Quality

Target:

- cvol/contracts/core/ManualVolOracle.sol

### Description

cvol/contracts/core/ManualVolOracle.sol:L111-L129

```
function setAnnualizedVol(
    bytes32[] calldata optionIds,
    uint256[] calldata newAnnualizedVols
) external onlyAdmin {
    require(
        optionIds.length == newAnnualizedVols.length,
        "Input lengths mismatched"
    );

    for (uint256 i = 0; i < optionIds.length; i++) {
        bytes32 optionId = optionIds[i];
        uint256 newAnnualizedVol = newAnnualizedVols[i];

        require(newAnnualizedVol > 50 * 10**6, "Cannot be less than
50%");
        require(newAnnualizedVol < 400 * 10**6, "Cannot be more than
400%");

        annualizedVols[optionId] = newAnnualizedVol;
    }
}
```

Magic numbers 50 and 400 are used in `setAnnualizedVol()`, which unnecessarily leads to potential error if the constants are changed during development.

### Recommendation

Consider using constant variables to replace magic numbers, as this would make the code more maintainable and readable while costing nothing gas-wise (constants are replaced by their value at compile-time).

### Status

This issue has been acknowledged by the team.

## 7. External call to an out of scope address

Severity: Informational

Category: Undefined Behavior

Target:

- core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol

### Description

core/contracts/vaults/BaseVaultWithSwap/RibbonThetaVaultWithSwap.sol:L320-L331

```
function stake(uint256 numShares) external nonReentrant {
    address _liquidityGauge = liquidityGauge;
    require(_liquidityGauge != address(0)); // Removed revert msgs due
to contract size limit
    require(numShares > 0);
    uint256 heldByAccount = balanceOf(msg.sender);
    if (heldByAccount < numShares) {
        _redeem(numShares.sub(heldByAccount), false);
    }
    _transfer(msg.sender, address(this), numShares);
    _approve(address(this), _liquidityGauge, numShares);
    ILiquidityGauge(_liquidityGauge).deposit(numShares, msg.sender,
false);
}
```

There is a **stake()** function in the **RibbonThetaVaultWithSwap** contract, which invokes the **deposit()** function of **liquidityGauge**. However, the code in **liquidityGauge** address is out of the audit scope and unknown to the auditors. Therefore, there may be potential risks when making an external call to **liquidityGauge**.

### Recommendation

Consider looking for an additional audit for the implementation of **liquidityGauge**. Also, consider disabling the **stake()** function for now.

### Status

This issue has been acknowledged by the team. The team has clarified that the **liquidityGauge** is uninitialized and is `address(0)` by default, as a result, the **stake()** function is disabled due to the `require(_liquidityGauge != address(0))` check.

## 8. Centralization risk

Severity: Informational

Category: Centralization

Target:

- All files

### Description

The addresses **Admin**, **Owner**, **keeper**, and **feeRecipient**, which have powerful control over the project, are all EOA addresses. If the private keys are compromised, the safety of the project will be seriously affected.

### Recommendation

Consider using multi-signature contract wallets.

### Status

This issue has been acknowledged by the team. The team has promised to use multi-signature wallets to mitigate centralization risk.

# Appendix

## Appendix A - Files in Scope

This audit covered the following files in commit [54a9960](#):
